

PRESS RELEASE

10/06/2013

National Inventory of Atmospheric Pollutants Emissions. Statistical data. Aragon.

Reference period: 1990-2011

The National Inventory of Atmospheric Pollutants Emissions is developed with the aim of evaluating and updating the anthropogenic emissions by sources and the sinks absorption every year.

The most important one of the seven Inventory's activity categories in emissions in Aragon is the energy processing (74% of total) which come from the use of fossil fuels.

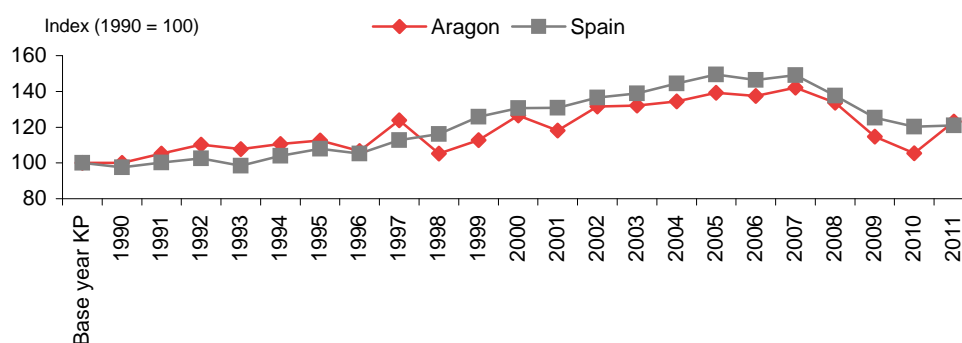

Aragon's total emissions in 2011 were 19.287 kilotonnes of oil equivalent, 23% higher than in 1990, and in Spain they increased up to 21% in the same period.

Atmospheric Greenhouse Gas Emissions (GHG) by activity category. Aragon, 2011.

Activity categories	Kilotonnes of CO ₂ equivalent	Percentage
Total Emissions	19.287	100,0%
1. Energy processing	14.238	73,8%
2. Industrial processes	1.018	5,3%
3. Use of solvents and other products	52	0,3%
4. Agriculture	3.513	18,2%
5. Land-use change and forestry	0	0,0%
6. Waste management and reduction	466	2,4%
7. Other	0	0,0%
